

Good Morning!!

Define the following:

Associative Property

Commutative Property

Distributive Property

**Did you remember to get
your textbooks covered?**

A blue-tinted photograph of a bookshelf. Two books are visible in the background, one on the top shelf and one on the bottom shelf. The text "BINS IN THE BACK..." is overlaid in the center of the image.

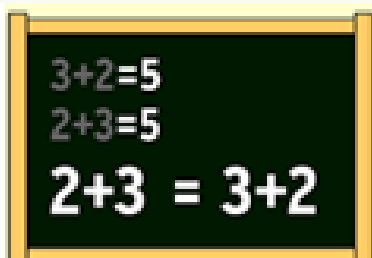

BINS IN THE BACK...

The associative property states that you can add or multiply regardless of how the numbers are grouped

$$\begin{aligned}2 + 7 + 5 &= 2 + 7 + 5 \\(2 + 7) + 5 &= 2 + (7 + 5) \\(\mathbf{9}) + 5 &= 2 + (\mathbf{12}) \\14 &= 14\end{aligned}$$

the Commutative Property is the one that refers to moving stuff around

$3+2=5$
 $2+3=5$
 $2+3 = 3+2$

The Distributive Property is an algebra property which is used to multiply a single term and two or more terms inside a set of parentheses.

$$\begin{aligned}5(x + 2) &= 5 \cdot x + 5 \cdot 2 \\(5x)(3x + 6) &= 5x \cdot 3x + 5x \cdot 6 \\(5)(3x^2 + 2x + 6) &= 5 \cdot 3x^2 + 5 \cdot 2x + 5 \cdot 6\end{aligned}$$

SECTIONS 2.1

FUNCTIONS ARE FUN!

If you see an asterisk*, then I would recommend you write the information in your notes :)

OBJECTIVE 1

DETERMINE WHETHER A RELATION REPRESENTS A FUNCTION

A *relation is a correspondence between two sets.

If x and y are two elements in these sets and if a relation exists between x and y , then we say that x corresponds to y or that y depends on x , and *we write $x \rightarrow y$.

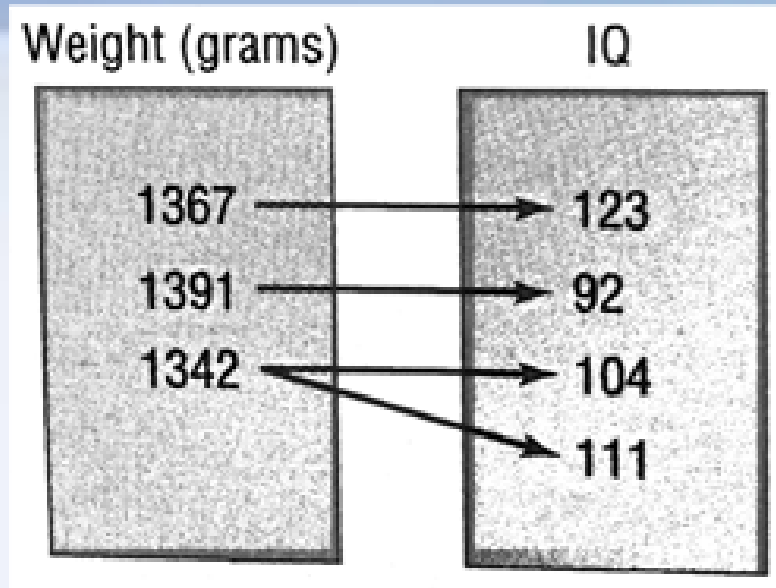

EXAMPLE.....

Maps and Ordered pairs as Relations

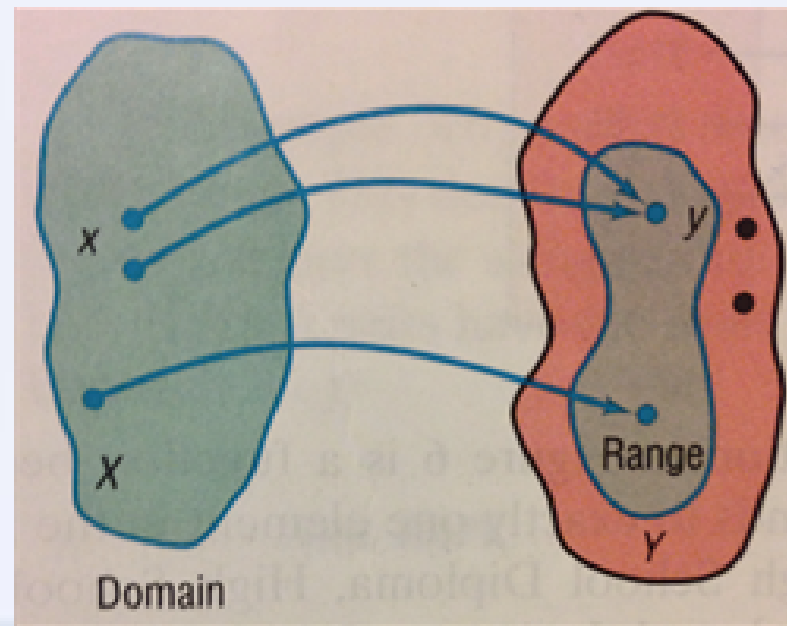

$\{ (\text{Alaska}, 7), (\text{Arizona}, 8), (\text{California}, 53), (\text{Colorado}, 7), (\text{Florida}, 25), (\text{North Dakota}, 1) \}$

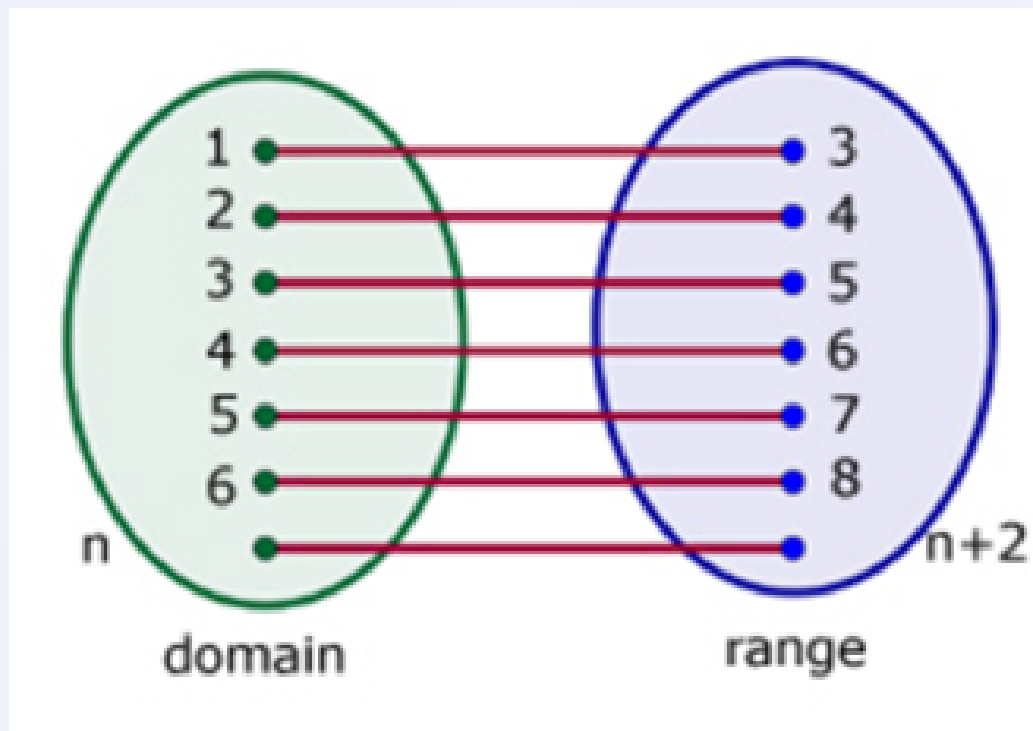

FUNCTION

Let x and y be two nonempty sets. *A function from x into y is a relation that associates with each element of x with exactly one element of y .

EXAMPLE.....

Determine whether a relation represents a function

EXAMPLE.....

Determine whether a relation represents a function

EXAMPLE.....

Determine whether a relation represents a function

EXAMPLE.....

Determine whether a relation represents a function

Determine whether each relation represents a function.
If it is a function, state the domain and range.

$$\{(2,3), (4,1), (3,-2), (2,-1)\} \quad \times$$

$$\{(\overline{-2}, \overline{3}), (\underline{4}, \underline{1}), (\overline{3}, \overline{-2}), (\underline{2}, \underline{-1})\} \quad \checkmark$$

$$\{(2,3), (4,3), (3,3), (2,-1)\} \quad \times$$

EXAMPLE.....

Determine whether an equation is a function

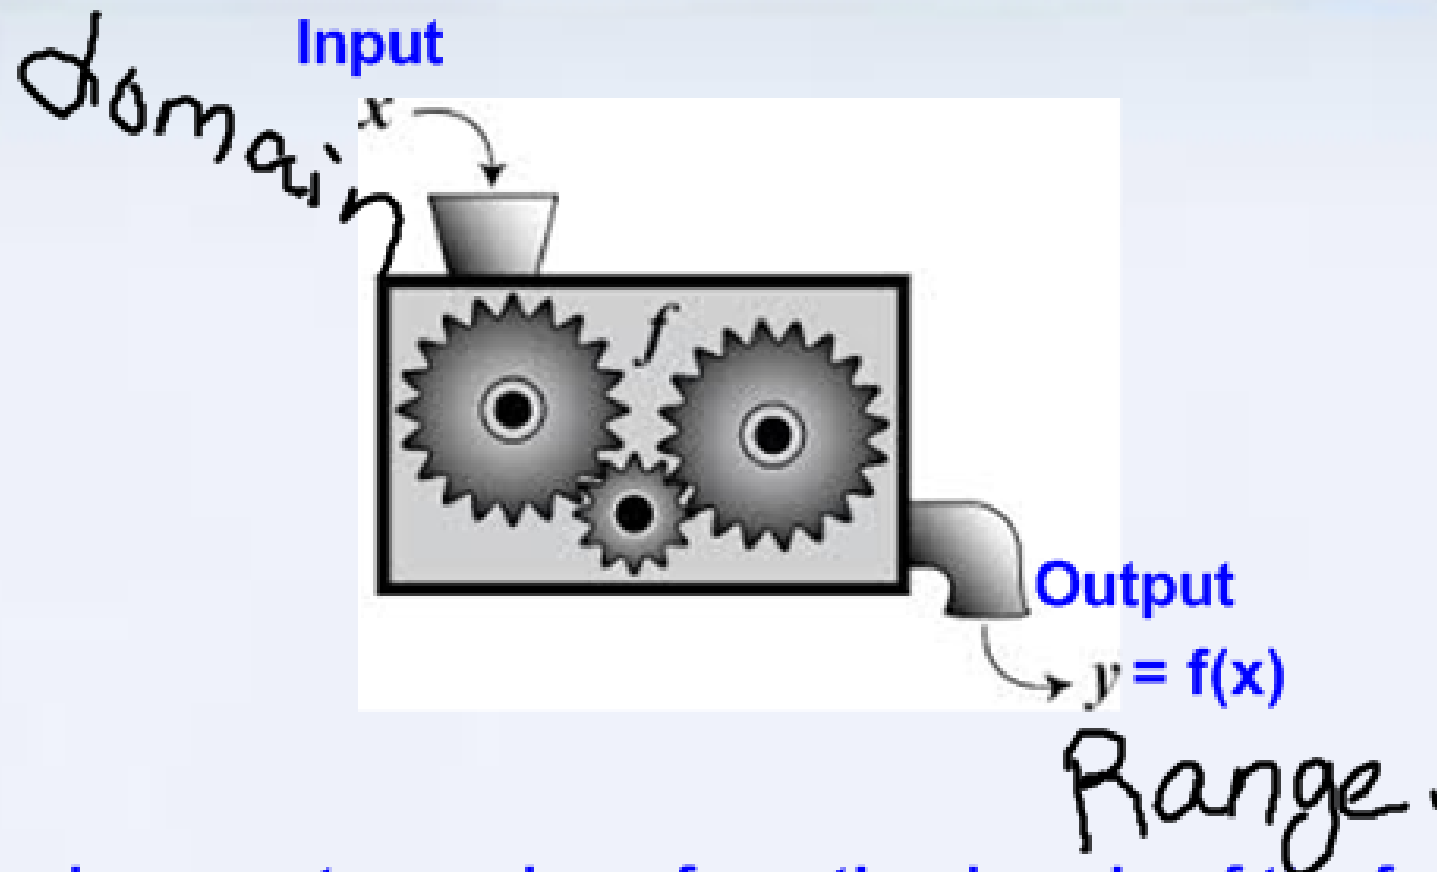

Determine if the equation $y = -\frac{1}{2}x - 3$ defines y as a function of x . We can do this by graphing the equation and seeing whether it passes the vertical line test.

Determine if the equation $x = 2y^2 + 1$ defines y as a function of x . We can do this by first solving for y then seeing if the graph passes the vertical line test.

OBJECTIVE 2

FIND THE VALUE OF A FUNCTION

FUNCTION MACHINE

- 1) It only accepts numbers from the domain of the function
- 2) For each input, there is exactly one output (which may be repeated for different inputs).

EXAMPLE.....

Finding Values of a Function

For the Function f defined by $f(x) = -3x^2 + 2x$, Evaluate.

$$(a) f(3) = -3(3)^2 + 2(3)$$

$$(b) f(-x) \quad -3(9) + 2(3)$$

$$(c) f(x+3) \quad -27 + 6$$

$$(d) f(x) + f(3) \quad f(3) = -21$$

$$(e) f(3x)$$
